

ModelsimSE installation tutorial

This tutorial hopes to help everyone and take less
detours. I use the system statement:

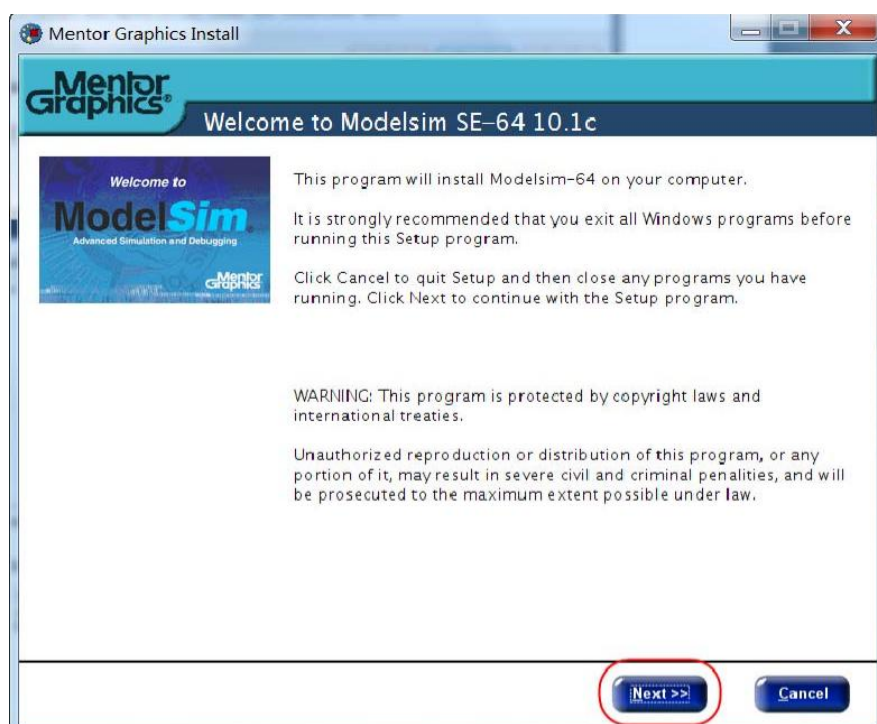

Win7 64-bit professional version

Remind that all virus checking software and security firewall must be closed before installation. Otherwise, a security prompt may pop up in the middle, which affects the normal installation of the software!

1. The Modelsim software version is Modelsim 10.1c. We provide the software 32-bit installation package and 64-bit package in the download address of the network disk. You can choose according to the specific operating conditions of your computer. My machine is win7 64-bit, so choose the installation package under the win64 folder. As shown below:

Double-click the installation package "modelsim-win64-10.1c-se.exe, the following interface appears: Click "Next" to continue.

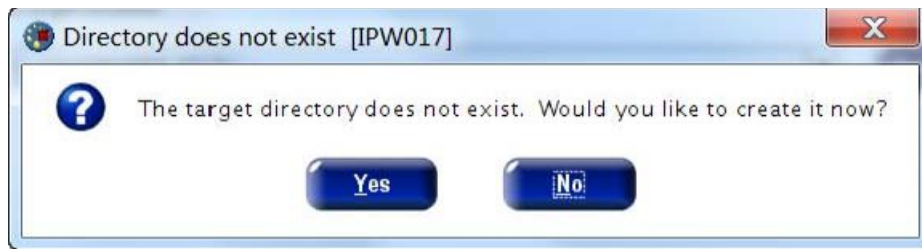

2, pop up the interface as shown below, select the

installation directory, it is recommended to use the default

c:\modeltech64_10.1c path, Note: The installation path can also be set by itself, but do not appear Chinese characters, click "Next" to continue

3, the following will pop up the prompt as shown, click "Yes" to continue

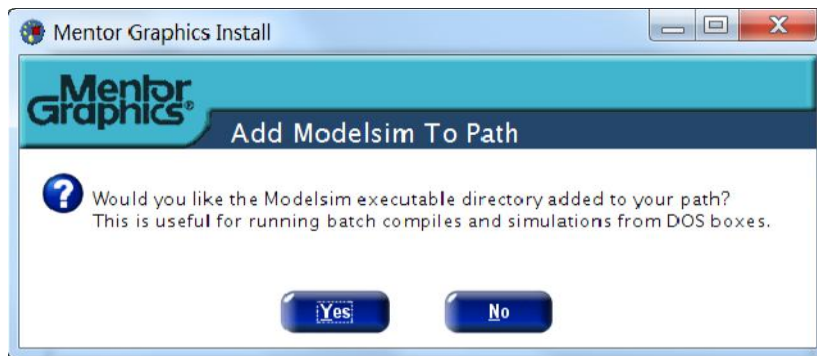

4, here to agree, click "Agree" to start the installation of the software

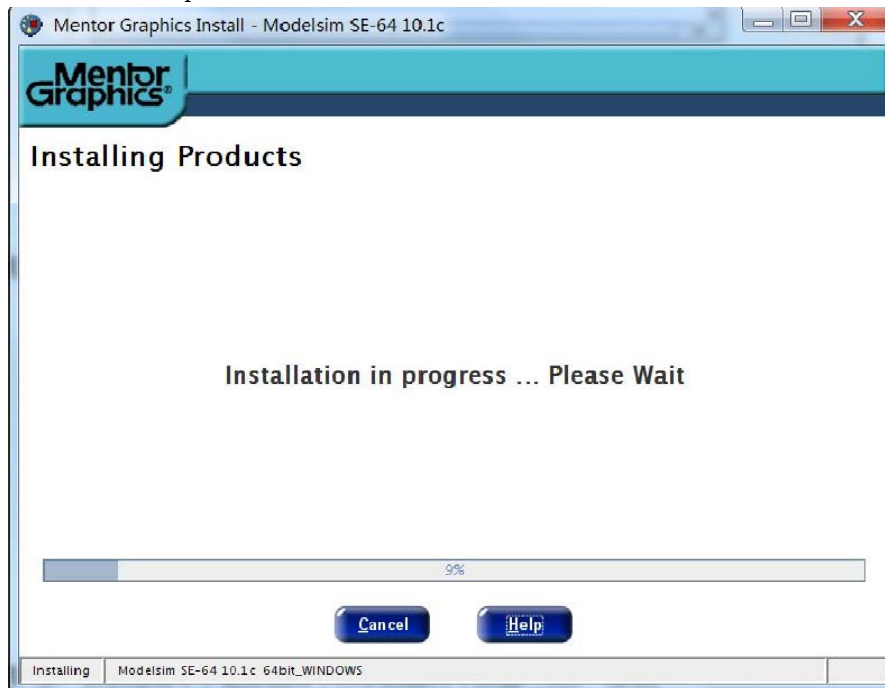

During the installation process, the window shown below will pop up, click "Yes" to continue.

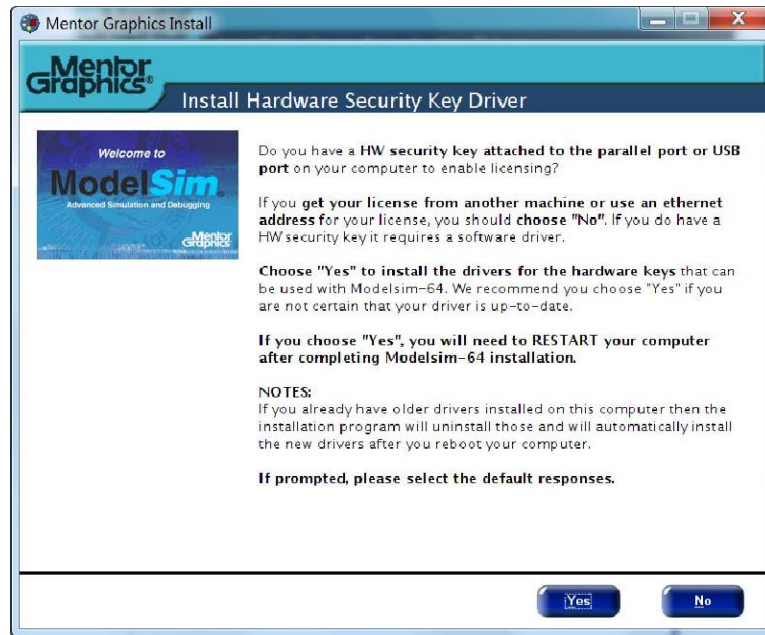

5. During the installation process, the following window pops up, click "Yes" to continue.

The installation process is as follows:

6, the installation is complete, the following interface pops up, click "Yes",

7. At the end of the installation, as shown in the figure, prompt us to restart the computer.

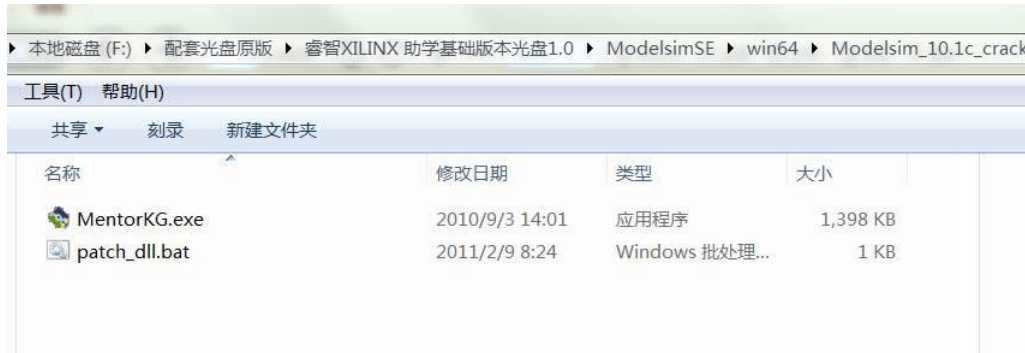

After rebooting, the Modelsim icon appears on the desktop of your computer. It is not working properly now, and then the Modelsim is cracked.

To sum up: the installation process is very simple, you can always select yes in the process, and finally reboot.

ModelsimSE crack tutorial

1. Open the "Modelsim 10.1c crack" folder. Copy the two files MentorKG.exe and patch_dll.bat as shown in the file folder.

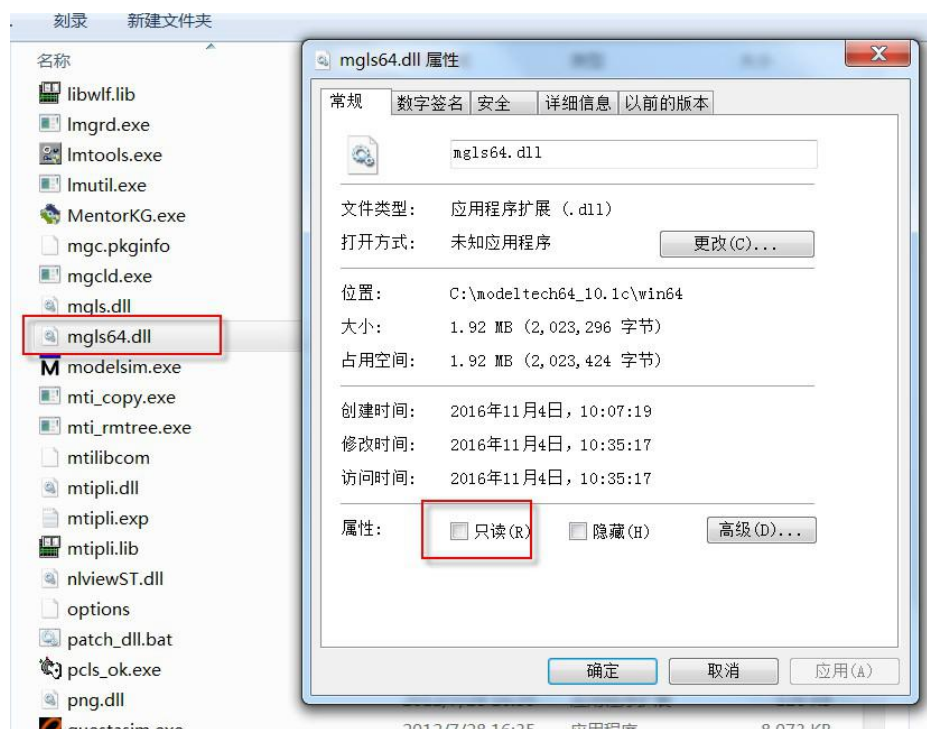

Paste into Modelsim's installation directory

"c:\modeltech64_10.1c\win64" folder. If your PC is a 32-bit system, copy the files under "Modelsim 10.1c crack" in the Win32 directory to the "C:\modeltech*\win32" folder.

2. Go to the win64 folder in the installation directory and find two files mgls.dll mgls64.dll.

3. Remove the read-only attribute;

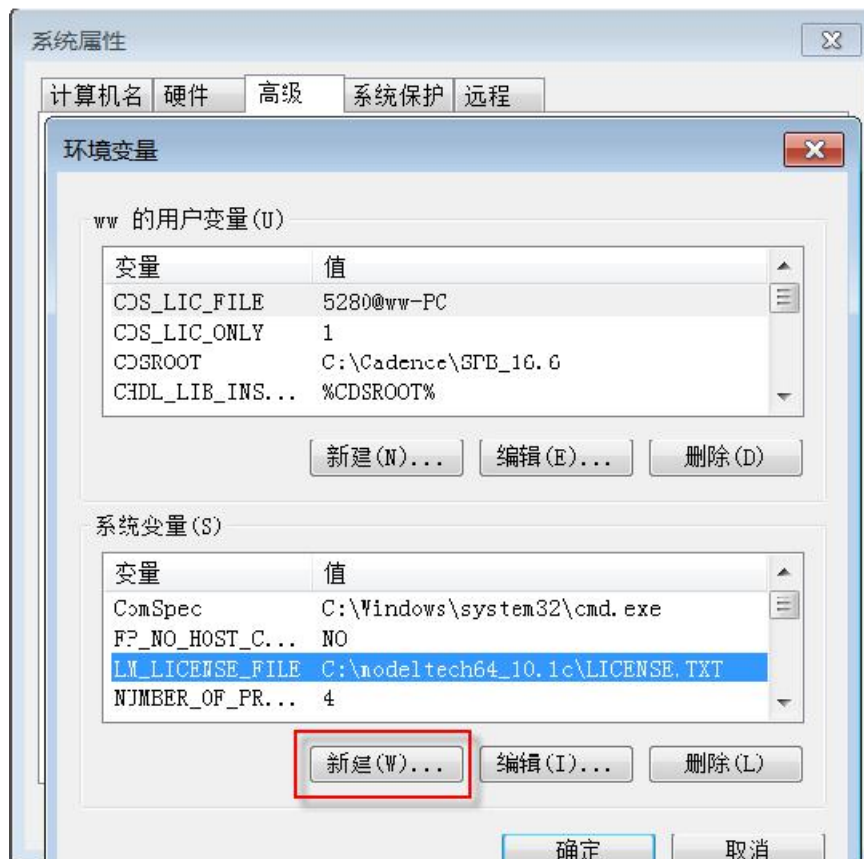

3. Run patch_dll.bat and wait for about 10 seconds to generate a TXT file.

Ben, save it as LICENSE.TXT, save the path to the win64 folder of your installation directory; (in this case: C:\modeltech64_10.1c\win64 folder)

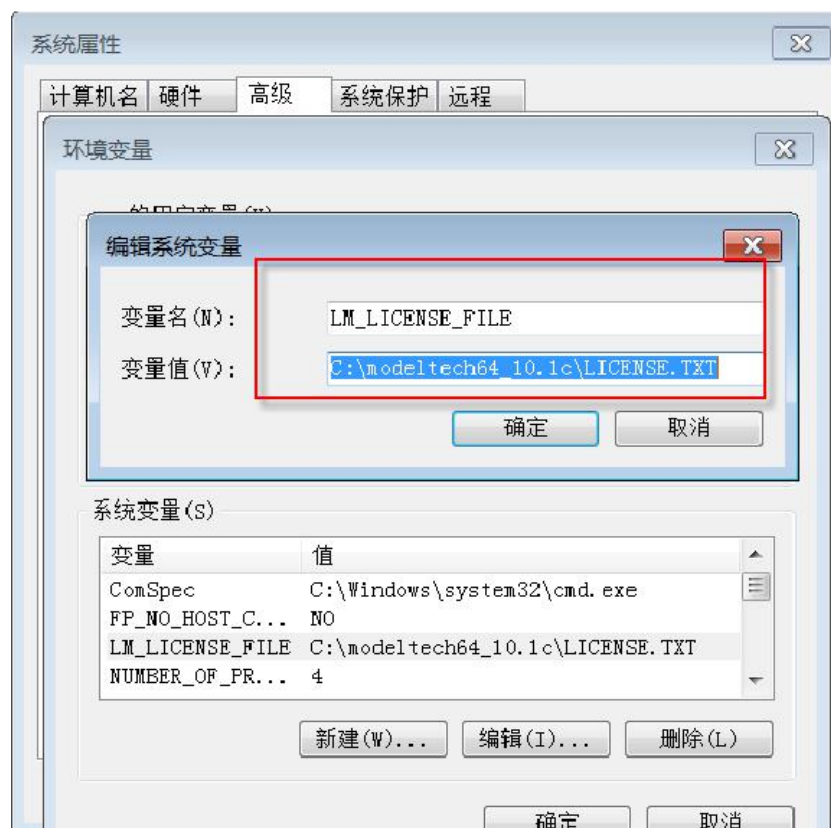

4 Restore the read-only properties of the two files mgls.dll and mgls64.dll;

5 Environment variable setting: This is the case in win7. Right click on this computer and select [Properties] » [Advanced System Settings]

[System Variable] Click [New] to open the edit dialog box.

Note: variable name here: LM_LICENSE_FILE (please copy the past)

The variable value is entered here

C:\modeltech64_10.1c\LICENSE.TXT (please copy the past)

This is actually the installation directory. Note that you can't be wrong, you can copy directly in my document, then modelsim will open normally.
